Ladder Scorecard

A companion to "Adoption Is Not Impact" · Measure Digital Transformation · Dr. Eddie Lin

AI initiative: _____ Launch date: _____ Owner: _____

How to use it: one metric per rung, each paired with a quality metric. Name rung 4 *before* launch. Italic examples are from a support rollout; replace them with yours.

Rung	Primary metric	Quality pair	Evidence needed	Result & status
1. Usage Using it?	*Weekly active share*	*Share of sessions with output used*	Trend since launch	
2. Behavior Working differently?	*Work started from an AI draft*	*QA pass rate, reviewers blind to AI use*	Vs. own pre-launch baseline	
3. Work outcomes Better, faster, cheaper?	*Tickets per agent-hour*	*7-day reopen rate*	**Comparison group:** difference-in-differences	
4. Business value A metric the business cares about?	*Cost per resolved ticket*	*Customer satisfaction*	Rung-3 causal estimate × finance assumptions	

Result & status: estimate with 95% CI, then On track / Watch / Off track. Rungs 1–2 are signals; claim impact only on rungs 3–4, with a comparison group.

Before you report, ask your analysts

- [ ] **What is the comparison group?** Teams or sites not launched yet.
- [ ] **Did the groups move in parallel before launch?** Plot it first.
- [ ] **What would we have seen without the AI?** Every impact claim depends on it.

Red flags: before-and-after numbers sold as "impact"; speed without its quality pair; one average for everyone.
